Datamatics
Business Solutions

We're building a new "Usage Insights" feature for our SaaS:

Track user events across product.

Show customers charts of their usage (by day, feature, team).

Notify them when usage crosses certain thresholds.

Design the architecture for backend, frontend, and data.

Implement a small, representative slice in code (just enough to show your style).

Deliverables

Architecture/design doc (2–4 pages):

High-level architecture diagram and components.

Data model: events, users, accounts, thresholds.

APIs: ingestion, query, alerts.

Data flow: ingestion → storage → aggregation → query/notifications.

Scaling and evolution strategy (first 3–6 months vs. later).

Code sample:

A narrow implementation slice:

e.g., POST /events + a simple query endpoint + one React page calling it.

Some tests around the core logic.
